

Concrete Burial Vaults – **A Natural Choice**

You may not think of a traditional ground burial as being green. But there are steps you can take – beginning with the use of a lined concrete burial vault – to make it more environmentally friendly. After all, concrete makes up more than 95% of the vault's construction and is produced locally from readily available materials – gravel, sand, cement and water – minimizing the depletion of our natural resources. And our commitment to nearby manufacturing and distribution reduces our reliance on fossil fuels to further contribute to a cleaner earth.

A lined and properly sealed concrete vault also protects the environment by preventing chemicals from escaping from the interior and seeping into the earth. At the same time, it protects your loved one nestled inside by prohibiting the outside elements from getting in. Isn't it nice to know you can protect your loved one and the environment?

Now that's something to think about.

Wilbert.
